

WP Ultimo Domain Mapping Process

The following steps will show you how to set up DNS manager to work with WP Ultimo's domain mapping feature.

1. Go to Settings > WP Ultimo and select "DNS Provider's NS" Under Mapping Method.

The screenshot shows the WP Ultimo settings interface. At the top, there are tabs: 'Getting Started', 'Default Records', 'DNS Provider', 'WP Ultimo', and 'License'. The 'WP Ultimo' tab is active. Below the tabs, the 'Mapping Method' section is displayed. It asks 'How do you want users to point their domain to your site at their domain name registrar?' and has two radio button options: 'A Record (WP Ultimo default)' and 'DNS Provider's NS'. The 'DNS Provider's NS' option is selected and circled in red. Below this is the 'Custom Domain Metabox' section, which allows modifying the text in the 'Custom Domain' metabox. It includes a 'Title' field with the value 'Custom Domain', a 'Description (Domain Mapping Supported)' field with the text 'You can use a custom domain with your website.', and a 'Description (Domain Mapping NOT Supported)' field with the text 'Your plan does not support custom domains. You can upgrade your plan to have access to this feature.' Both description fields also show 'Available shortcodes: {{ip-address}}, {{domain}}'.

2. You can optionally customize the information your client will see in WP Ultimo's interface using the fields on this page.
3. Your client will map his or her domain as usual on the Account screen.
